

Kaberi Dasgupta is a Physician Scientist and Associate Professor of Medicine at McGill University and McGill University Health Centre in Montreal, Canada. Her research addresses the prevention and management of diabetes through health behaviour change. In recent years she has demonstrated spousal concordance in diabetes and proven that gestational diabetes predicts diabetes in fathers as well as mothers. She leads the development and testing of a multimodal diabetes prevention program following gestational diabetes based in Montreal that is expanding to the indigenous Cree territories of Quebec. Dr. Dasgupta's work is funded by the Canadian Institutes of Health Research, the Lawson Foundation, the Medavie Foundation, the Canadian Diabetes Association, and the Fonds de recherche du Québec - Santé (FRQS).
