Neurobiological research generally assumes that brain mechanisms alone will ultimately suffice to explain all psychologically described phenomena. This assumption stems from the idea that all causal mechanisms relevant to neuroscience can be formulated solely in terms of the principles of classic Newtonian physics. Thus, terms having intrinsic experiential content (e.g. 'feeling', 'observing' and 'effort') are not included as primary causal factors. This theoretical perspective is dictated by ideas about the natural world that have been known to be fundamentally incorrect for more than three-quarters of a century. Contemporary physical theory differs profoundly from classic Newtonian physics on the important matter of how the consciousness of human agents enters into the causal dynamics of empirical phenomena. The new quantum principles contradict the older idea that mechanical processes alone can account for all observed empirical data. Contemporary quantum physical theory brings directly and irreducibly into the overall causal structure certain psychologically described choices made by human agents about how they will act. This key development is applicable to neuroscience, and it provides neuroscientists and psychologists with an alternative conceptual framework for describing neural processes. The new framework, and specifically the well described physical principle known as quantum Zeno effect, enables scientists and clinicians to better understand the neuroplastic mechanisms relevant to the growing number of studies demonstrating the capacity of directed attention and mental effort to systematically alter brain function. Clinical and neuropsychological findings from research on obsessive-compulsive disorder, placebo effect, stroke, and normal human psychology will be discussed and elucidated in light on this theoretical paradigm shift. Learning Objectives:

- 1. Learn how sufferers with Obsessive Compulsive Disorder can improve symptoms while ameliorating pathological brain circuits
- 2. Gain a greater understanding of how focused attention can alter brain circuitry
- 3. Learn how placebo effect is related to effects of expectation on focused attention
